ABSTRACT

Summary: Biogem provides a software development environment for the Ruby programming language, which encourages community-based software development for bioinformatics while lowering the barrier to entry and encouraging best practices.

Biogem, with its targeted modular and decentralized approach, software generator, tools and tight web integration, is an improved general model for scaling up collaborative open source software development in bioinformatics.

Availability: Biogem and modules are free and are OSS. Biogem runs on all systems that support recent versions of Ruby, including Linux, Mac OS X and Windows. Further information at <http://www.biogems.info>. A tutorial is available at <http://www.biogems.info/howto.html>

1 INTRODUCTION

In biomedical science, new technologies, data formats and methods emerge continuously. Scientists want to take advantage of these developments as soon as possible, which requires bioinformatics

software to keep up with new requirements. We support the notion of the Open Bioinformatics Foundation (OBF) that development of collaborative open source software (OSS) is essential for bioinformatics. The OBF represents a number of important projects, such as BioPerl (Stajich *et al.*, 2002), Biopython (Cock *et al.*, 2009), BioRuby (Goto *et al.*, 2010) and BioJava (Holland *et al.*, 2008). These Bio-star (Bio*) projects effectively function as community centres and share a centralized approach in software development with large source code repositories. Bio* projects, generally, aim for consolidated tools, a stable application programming interface (API), and backwards compatibility.

Within the BioRuby project we experienced the drive for stability easily overwhelmed and discouraged developers. Not only because of the complexity of the existing code base, but also because coding standards are enforced, and extensive tests and documentation are required. Furthermore, newly contributed code may be subject to community scrutiny, and in many cases further demands for improving the code follow. The full process introduces a significant delay between initial idea and final acceptance of the code in the main project. Months, even years, may pass between stable releases of main Bio* projects. It may take a long time before a new feature is publicly released.

To scale up collaborative software development in BioRuby, we recognized existing and new developers need to be encouraged to contribute more code. To achieve this, we created Biogem a Ruby application framework for rapid creation of decentralized, internet published software modules written to lower the barrier to entry. Biogem was initially inspired by the R/Bioconductor

The primary tool of the Biogem framework is a software generator consisting of templates for bioinformatics scripts, source

The Biogem website (see Availability) makes it easy to find and install software modules. The website also allows people to track releases, software dependencies, development activity, outstanding issues, integration test results, documentation and popularity of

Table 1. The introduction of Biogem has led to a broad range of new BioRuby plugins

Name	Description
bio assembly	Read and write assembly data
bio blastxmlparser	Fast, low memory, big data BLAST parser
bio bwa	Burrows Wheeler aligner
bio cnls scraper	Nuclear localisation signal prediction
bio six frame	Sequence translation
bio genomic interval	Detect intervals
bio gff3	Fast, low memory, big data GFF3 parser
bio isoelectric point	Calculate protein isoelectric point
bio kb illumina	Illumina annotations
bio lazyblastxml	Another BLAST XML parser
bio logger	Sane error handling
bio nexml	NeXML support, for phylogenetic data
bio ngs	NGS workflows and display, included support for Bwa, Bowtie, TopHat, and Cufflinks
bio octopus	Transmembrane domain predictor interface
bio restriction enzyme	DNA cutting operations with REBASE
bio samtools	Samtools API
bio signalp	Signal peptide prediction interface
bio sge	Split huge files for cluster computing
bio tm hmm	Transmembrane predictor interface
bio ucsc api	UCSC Genome Database binding

An up-to-date list can be found at <http://biogems.info>.

published modules. A map shows the location of Biogem developers to help foster a sense of international community.

Biogem encourages software development best practices by providing templates for documentation and multiple test driven development strategies; such as unit tests, behaviour driven development and a natural language parser for software specification (e.g. Chelimsky *et al.*, 2010). A notable difference to the traditional code contribution procedures of the Bio* projects is that best practices are encouraged, rather than enforced.

Templates are also included for certain types of functionality, e.g. to generate portable SQL database handlers, and to build a dynamic website. With Biogem it is possible to create a functional web application, or service, in just a few steps. Generating the different features is handled through work flows (Fig. 1).

We added tutorials for Biogem, which explain the software generators, templates and software publishing. These tutorials are part of the software distribution and available online.

We created ‘collections’ that bundle important modules together as specific releases. For example, ‘bio-core’ contains stable modules, and ‘bio-core-ext’ contains stable modules with bindings to C libraries. Special purpose collections exist such as ‘bio-biolinux’, which is distributed by the Cloud Biolinux project and merged with the Galaxy CloudMan project (Afgan *et al.*, 2010).

In the first 8 months of the Biogem functionality becoming available, over 20 new modules have been published through Biogem, showing a wide variety of subjects. These modules,

for example, target big data handling, next generation sequencing and parsing of bioinformatics data formats (Table 1).

3 CONCLUSION

Biogem provides an environment for rapid bioinformatics software development with a low barrier to entry. Biogem frees potential contributors from code maturity expectations that can be deterring, and encourages Ruby developers to contribute experimental source code early to the BioRuby community. Through Biogem software is published in a modular way, and best practises are encouraged through infrastructure for software specification and testing. All this results in better utilization of existing and new software development manpower, thereby scaling up OSS development in bioinformatics.

We suggest Biogem can serve as a generic model; not by replacing existing Bio* projects, but by supplementing them with a decentralized and evolutionary model for collaborative software development.

ACKNOWLEDGEMENTS

We thank our four reviewers for constructive and detailed comments; reviewers Brad Chapman and Hilmar Lapp identified themselves. We also thank Steffen Möller for comments.
